Human Impacts on the Environment – Home Practice

Focus: Pollution · Biodiversity · Invasive Species · Sustainability

Reading Passage:

Human activities such as pollution, habitat destruction, invasive species introduction, and overuse of resources can harm ecosystems. Pollution contaminates air, water, and soil, affecting plants and animals. Habitat destruction removes the homes and feeding areas of many species. Invasive species often take over and outcompete native organisms. Overexploitation reduces biodiversity and weakens ecosystems. Sustainable practices can help restore balance.

1. List two types of pollution and how each can harm ecosystems.

2. Explain what habitat destruction is and give one example.

3. What is an invasive species? Name one example.

4. Describe how overexploitation affects biodiversity.

5. Write a 4-step chain reaction showing how one human activity can impact multiple species.

6. Give one sustainable solution for reducing human impact.

7. Write a 2–3 sentence summary explaining why biodiversity is important for ecosystem stability.

Tutoring Tip:

Connect each answer to a real example from Ontario when possible.
